

# Activity: Resident Scenario

*Edward is 75 years old with a history of angina (chest pain), high blood pressure, and type 2 diabetes which is diet and medication controlled. He walks independently but has dementia and can wander.*

*In the last few hours he has been more aggressive and lashed out physically. He has been seen rubbing his left arm and looks pale and sweaty. The PCW looking after him today is concerned about his anger and has just spoken to you about Edward's behaviour using CUS.*

What signs of deterioration are there?
