

Activity: Communication Scenario

Edgar is 75 years old with a history of angina, high blood pressure and type 2 diabetes, managed with diet and medication. He has dementia, walks independently and is known to wander.

Lee, a PCW, has come to you and said, “I feel uncomfortable as Edgar is being aggressive and hitting people. He looks sweaty, is moaning like he is in pain holding his hand on his tummy. His pants are wet with small amounts of urine.”

What assessments will you do?

What nursing care may he require?

How will you communicate any referral or escalation if necessary? To whom?

What information should you feedback to Lee?
